

FISH OIL

PRELUDE

Fish oil being a good source of essential fatty acids, shelters two important contents called EPA (Eicosapentaenoic acid) and DHA (Docosahexaenoic acid). Fish oil supports the growth of animals at least equal to that of any other source of fat in the diet. All the constituents of essential fatty acids have shown growth promoter in factors in animals

SPEEDPIAL offers durable Fish oil that has high nutrient value. Enriched with protein fat and Omega 3 essential fatty acids EPA and DHA, the fish oil offered by SPEEDPIAL are concentrated nutrients having correct dosage of protein, calcium, minerals, fatty acids and omega 3 fatty acids. This oil used as feed supplement offers great nutritional value.

SPEEDPIAL is engaged in offering Crude fish oil that offers critical solutions to number of industries for its versatile application features. We use most fresh and chemical free fish for oil extraction. Our manufacturing unit has the requisite hi tech machines for oil extraction. This oil finds application in different industries. The crude oil is known in the animal feed industry for scaling up the growth and feed conversion rate (FCR).

NATURAL QUALITY PRODUCT

The emphasis is on marine fish oils in their original form and our products comply with all regulations for feed application. The products meet official regulatory standards with regards to environmental contaminants, and are free of genetically modified materials (GMO) and components. The products are delivered in variable package sizes of buckets and drums.

THE PROCESS

Depending on the requirements of the final product the feed oils may go through two or more of the following processing steps:

Neutralization: The oil is neutralized by removing free fatty acids using caustic soda.

Bleaching: Pigments and contaminants are removed by the use of adsorbents such as bleaching earth and activated carbon.

Winterization: High melting triglycerides are removed by cooling the oil and filtering off the solid fraction.

Deodorization: Volatile components are removed with steam injection under high vacuum and elevated temperature.
